

# SEPM GIS Data Migration

Data Transfer Spot On

## Migration of GIS Data

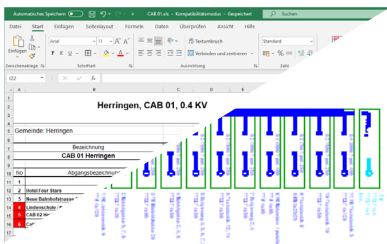

### Generation of topology from Geoschema

Extracting the network from the geometries location

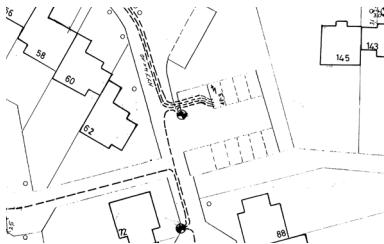

### Geometric manipulations

Extension of trenches and routes at manholes, generation of aerial routes from poles, etc

### Excel/parts lists

Generation of station internals from alphanumeric data

### Rasterkarten

Transfer of scanned raster maps and orthophotos

## Range of services

### Migration Project

- > Project management
- > Analysis/Inventory of existing data models and data
- > Specification of the mapping to the target system
- > Data transfer to the target system
- > Data conversion and refinement
- > Coordinate system conversion
- > Quality assurance

### Methodology

The SEPM services include the complete and economical transfer of geographical data from the source to the target system.

Depending on requirements, the data can be either: One, transferred directly from the source to the target system. Two, copied into a temporary staging database before migration. Or three, loaded into the target system via exports from the source system (for example DXF or raster).
